

SANDBOX WINTER 22/23

On a snowy night in 2003, Kevin Sansalone and a group of riders looked out the window of their lodge to see a driveway full of pick up trucks, snowmobiles, and snowboards all lightly dusted with fresh snow. They laughed, thinking the scene looked like an big kids sandbox.

A few years later, Whistler/Blackcomb implemented mandatory helmets in the highest level park. In 2007, wearing a helmet was not the norm. To abide by the rules while considering his image conscious riders, Kevin developed the Classic helmet – the first helmet with a brim that didn't compromise style for function. What began as purely making product so the guys could ride the park became the most sought after and recognizable snowboard helmet brand in the world.

Sandbox helmets fuse protection and style that speaks to our roots in boardsports. Our aesthetic elevates the concept of head protection from a nuisance to a must-have accessory, while never compromising our commitment to quality and safety.

We love what we do and we use what we make, every day. Thanks for taking Sandbox along for the ride.

STYLE

As a uniquely rider owned company we understand the importance of creating products with industry leading protection that riders actually want to wear. From the signature brim on the Classic to the street inspired style of the Icon we have continued to develop our collection. This season introduces a new style for snow and street, the Icon; an evolution of the Legend with our patented airflow venting system and refined silhouette design.

PROTECTION

We understand that action sports and our riders needs are continually evolving and progressing. Our dedication to progression and creativity makes Sandbox one of the industry's most respected and well loved helmet choices. That's why we have certifications for snow, street and water sports. From hardcore EPS to flexible EVA foam, we have you covered all year round.

COMFORT ELEVATED

This season introduces a new comfort liner and ear pad lining made with grid fleece, which not only improves fit but elevates comfort as excess heat escapes through the grid lines and vents through our patented airflow technology.

Furthering our commitment to protection, we have partnered with Mips® to offer their patented safety system on select models. Mips® is intended to help reduce the impact of rotational energy to the head by enabling a relative movement between the head and helmet.

TECH + CONSTRUCTION

Mips®

Mips

PATENTED
SAFETY SYSTEMLOW FRICTION
LAYERFOUNDED
IN SCIENCE**Mips® safety system functionality**

We know from scientific research that the brain is particularly sensitive to rotation. In the event of an impact, the helmet technology provided by a Mips® safety system is intended to help reduce the impact of rotational energy to the head by enabling a relative movement between the head and helmet.

When such an impact occurs the forces the build-up between the head and helmet are immense. These forces can be compared to the weight of up to 10 people suddenly standing on your head. Under such high pressure, the friction between head and helmet makes it hard for the helmet to move – even if the straps are slightly loose or if the helmet doesn't have a properly secure fit as recommended by the manufacturer. But a Mips® low-friction layer inside a helmet can still allow omni-directional movement of 10-15mm when that high load occurs.

Energy redirection

Most helmets that are certified by industry-accepted safety standards are capable of reducing the energy of a straight, linear impact. But when it comes to angled impacts, which is the most common type of impact from crashes or falls, a Mips® safety system-equipped helmet can also help reduce harmful rotational energy.

Think about a fall on a slippery slope: If you fall and hit your head (or helmet), you will most likely continue in the same direction as before the fall. Alternatively, consider a similar fall on high-friction asphalt – a very different scenario. When your helmet hits the ground, there will most likely be a sudden stop and a rotation of the helmet. Mips® intends to redirect that energy away from the head.

Proven in the Test Lab

When a manufacturer decides to create a helmet equipped with a Mips® safety system, they work closely with the engineers at Mips to tailor the system to each particular helmet model and size. Once the design has been set, helmets in all sizes are sent for testing approval of the design of this specific Mips® safety system at our state-of-the-art test lab in Sweden. We impact-test the same helmet model (and size), comparing helmets equipped with the Mips® safety system to ones without.

Mips® tests are performed by putting the helmet on a dummy head called Hybrid III that is equipped with accelerometers. Each test is filmed with a high-speed camera. The pulse of the acceleration is captured and sent to our computers, which simulate what happens during the impact. When we analyze the data and the film, we can see that: The rotational kinematics are reduced with the Mips® low-friction layer installed.

The strain in the brain appears in the model to be significantly reduced with the Mips® low-friction layer installed. The film shows that the helmet has moved 10-15mm in relation to the head, creating a small but sometimes crucial relative motion between the head and the helmet.

In summary, the difference between a helmet with and without a Mips® safety system is that a Mips® safety system allows the helmet to rotate 10-15mm relative to the head on angled impacts. Every helmet available to consumers with a Mips® safety system has passed Mips® strict testing protocols.

TECH + CONSTRUCTION

PATENTED AIRFLOW

AIR FLOW

Our patented Airflow system is designed to let air enter the helmet from below the brim and through the front Slash Vent. This air flow then moves through channels in the liner that run up and over the crown, collecting excess heat and moisture rising up the Chimney Vents, exhausting it all out the Rear Vents. The end result? A cooler ride.

AVAILABLE MODELS

- Icon / Classic MIPS
- Icon / Classic Snow
- Icon / Classic Junior
- Icon / Classic Park

W 22/23 // AIR FLOW

CHIMNEY VENTING

To help keep you cool, we added Chimney Vents that allow heat to rise passively through the eight vents in the crown. This heat then meets the helmet's Air Flow system and is pushed out the Rear Vents.

AVAILABLE MODELS

- Icon / Classic MIPS
- Icon / Classic Snow
- Icon / Classic Junior
- Icon / Classic Park

W 22/23 // CHIMNEY // VENTING

GOGGLE VENTING

We designed the Goggle Venting system to work seamlessly with most goggles. Heat and moisture are drawn from your face and eye wear, up through channels in the EPS liner and out the Rear Vents.

AVAILABLE MODELS

- Icon / Classic MIPS
- Icon / Classic Snow
- Icon / Classic Junior
- Icon / Classic Park

TECH + CONSTRUCTION

PROTECTION

BOMBSHELL CONSTRUCTION

All Sandbox helmets are constructed with an injection molded ABS Bombshell to withstand high impacts. Bombshell construction offers unparalleled durability, for tough, resilient protection where you need it most!

EPS FOAM

All Sandbox Snow helmets come with a hard EPS (Expanded Polystyrene) foam designed for high-impact protection.

TECH + CONSTRUCTION

FEATURES

TRIP CLIP

Our classic Trip Clip is featured on our Classic and Icon Snow models. The slide-on/slide-off goggle clip offers three positions so you can work around your goggle strap buckle and adjusters.

AVAILABLE MODELS

Icon / Classic MIPS
Icon / Classic Snow
Icon / Classic Junior

COMFORT LINER

Available on all our Snow models, this plush grid fleece and breathable mesh liner offers the best of both worlds: comfort and warmth along with heat management. It's removable and washable too.
